

ABSTRACT

A method for communication over a network, such as the Internet, including the steps of retrieving at least audio signals, digitising the signals into digital signals, transferring the digital signals to broadcasting means and making the digital signals accessible over a network, such as the Internet. The method includes the steps of retrieving at least audio signal in a mobile telecommunication device, and transferring at least audio signals from the mobile telecommunication device to a corresponding receiving telecommunication device over a wireless connection.

A mobile telecommunication device is used for retrieving at least audio signals and the mobile telecommunication device is connected in a wireless connection to the corresponding receiving telecommunication device. The receiving telecommunication device is operatively connected to a combined digitising, packaging and broadcasting device that is connected to the Internet.
